Tote Mixer Offers Better Quality Control!

Better liquid uniformity and product quality control was the objective with an adjustable, multi-impeller tote mixer design says the manufacturer, DRUM-MATES Inc. With a *minimum* of 3 levels of turbine impellers in stainless steel or Teflon the powerful DM-600TAS is excellent for blending polymer compounds and sensitive chemicals that tend to stratify or form

bottom sediments because it mixes all levels simultaneously. Other benefits include: very wide viscosity mixing range, significant time savings, safer bung-hole entry mixing to prevent fume and splash-out exposure (while preventing moisture or atmospheric contamination) and greatly increased batch productivity. Sensitive compound shear effects and air entrapment are prevented while effectively blending in 200 to 1000 gallon totes. A range of accessories are available for various applications and for mixing in wire, tubular and round framed IBCs.
